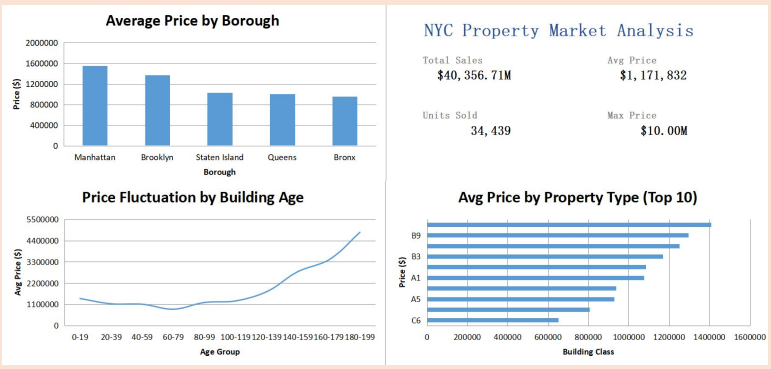
DV-Sheet:Dashboards-Bad Case

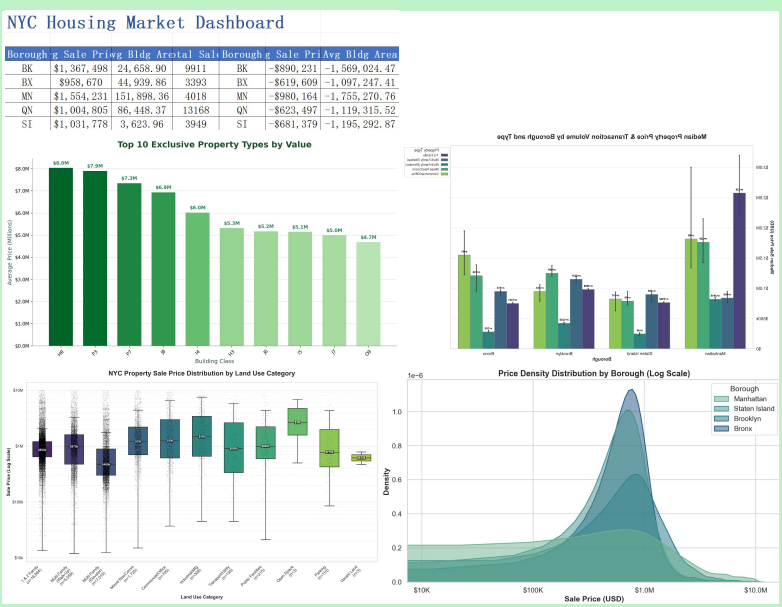
Error Category:
★ Data Logical Consistency
★ Visualization Design

Query:
I've noticed that the property prices in New York vary greatly. This table is not very intuitive. Could you please create a dashboard for me to analyze the fluctuations in property prices? This would help me compare the market performance of different property types in various districts.

Gemini-3-pro:



Ground Truth:



Borough	g Sale Pri	wg Bldg Are	tal Sale	Borough	g Sale Pri	Avg Bldg Area
BK	$1,367,498	24,658.90	9911	BK	-$890,231	-1,569,024.47
BX	$958,670	44,939.86	3393	BX	-$619,609	-1,097,247.41
MN	$1,554,231	151,898.36	4018	MN	-$980,164	-1,755,270.76
QN	$1,004,805	86,448.37	13168	QN	-$623,497	-1,119,315.52
SI	$1,031,778	3,623.96	3949	SI	-$681,379	-1,195,292.87

Error Analysis:

★ **Incorrect Data Aggregation:** The "Price Fluctuation by Building Age" chart uses averages which are highly sensitive to outliers in real estate. The standard dashboard correctly prioritizes medians to represent the "typical" price.

★ **Unfiltered Data Noise:** The first picture likely includes low-value non-market transfers (e.g., $0 or $1 sales), whereas the standard dashboard applies a Price Validity Filter (>$1,000) to ensure market relevance.

★ **Missing Multidimensional Analysis:** The charts lack secondary encodings (like color-coded legends for property types within borough charts) required to answer complex market questions at a glance.

★ **Vague Categorization:** The "Avg Price by Property Type" uses cryptic codes like B9, B3, A1 without providing the full descriptive labels (e.g., "Walk-up" or "Elevator Apartments") found in the standard dashboard, reducing readability for non-experts.

Percentage Of Score: 21.43%
