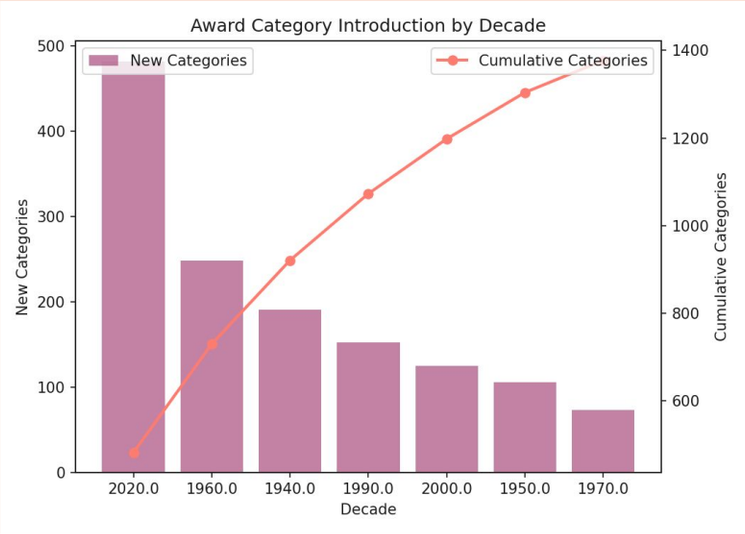
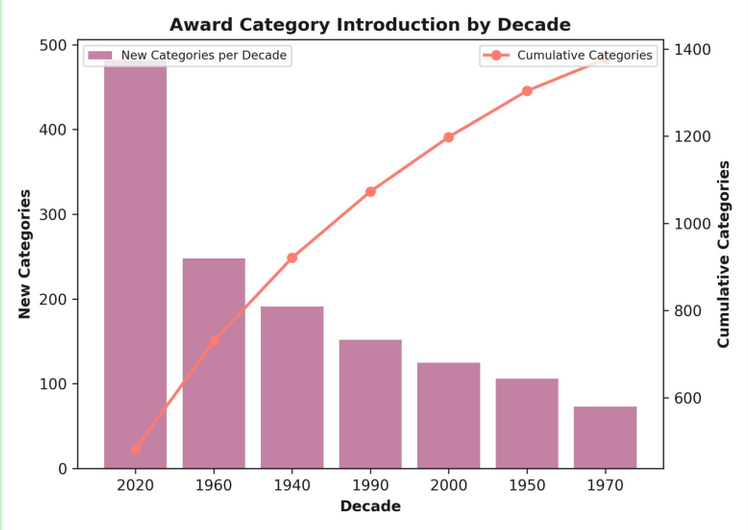
DV-Evol Good Case——plotly.js

Question:
- Sort Decade by New Categories per Decade (nunique Award Name) DESC; ties -> Decade ASC.
- Recompute Cumulative Categories as cumsum AFTER sorting (match bar order).
- Change cumulative line+markers color to #FF6F61; everything else unchanged.

GPT-5.2:



Ground Truth:



Successfully completed:
- The Decade order was re-sorted by "New Categories per Decade" in descending order (2020 → 1960 → 1940 → 1990 → 2000 → 1950 → 1970), matching the reference.
- The "Cumulative Categories" line was recomputed as cumsum AFTER the reordering, and the line points align with the bar sequence correctly.
- The cumulative line + markers were changed to an orange/coral tone (≈ #FF6F61), consistent with the reference.
- The dual-axis structure was preserved: left axis = bars, right axis = cumulative line (twinx).
- Bar styling (purple with transparency) and overall bar heights/relationships remain consistent.

Percentage Of Score: 98.875%
